DISBASE: Defects in FGFR1 are one of the causes of Pfeiffer syndrome (PS) [MIM:101600]; also known as acrocephalosyndactyly type V (ACSS). PS is characterized by craniosynostosis (premature fusion of the skull sutures) with deviation and enlargement of the numbs and great toes, brachymesophalangy, with phalangeal ankylosis and a varying degree of soft tissue syndactyly. DISBASE: Involved in a t (8:13) (p12:q12) chromosomal translocation which involves FGFR1 and ZNF199: The resulting transcript is a possible candidate for seem cell leukemia lymphoma syndrome/SCLi. SIMILARITY: Belongs to the fibroblast growth factor receptor
                                                                                                                                                                                                       X-RAY CRYSTALLOGRAPHY (2.0 ANGSTROMS) OF 464-762.

Biochie. Blochys. Res. Commun. 205:1057-1063 (1994).
-!- FUNCTION: Receptor for basic fibroblast growth factor. A shorter form of the receptor could be a receptor for acidic FGF (aFGF).
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCE FROM N.A. Science 245:57-60(1989).
-!- FUNCTION: RECEPTOR FOR BASIC FIBROBLAST GROWTH FACTOR.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the fibroblast growth factor receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (POTENTIAL).

Proc. Natl. Acad. Sci. U.S.A. 87.8365-8369(1990).
-!- FUNCTION: RECEPTOR FOR BASIC FIBROBLAST GROWTH FACTOR.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the fibroblast growth factor receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -!- SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.

-!- FUNCTION: RECEPTOR FOR ACIDIC AND BASIC FIBROBLAST GROWTH FACTORS.

POSSESSES A HIGHER APPINITY FOR ACIDIC THAN FOR BASIC FGF'S.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- ALTERNATIVE PRODUCTS:

Brotn=Alternative splicing; Named isoforms=2;
Name=Long;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BY SIMILARITY.

"A distinctive family of embryonic protein-tyrosine kinase
receptors."; Acad. Sci. U.S.A. 87:5812-5816(1990).
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine BDP + protein
tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the fibroblast growth factor receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              family.
-!- SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .,

Tisolation of cDNA encoding a binding protein specific to 5'-
Dhosphorylated single-stranded DNA with G-rich sequences.";

Nucleic Acids Res. 21:1766-11766 (1993).

-!- FUNCTION: DNA-binding protein specific to 5'-phosphorylated single-stranded guanine-rich sequence related to the immunoglobulin mu chain switch region. Preferentially binds to the motif (5'-GGGCT-3').

-!- SUBCELLULAR LOCAGTION: Nuclear (Potential).

-!- SIMILARITY: Belongs to the DNAZ/NAM7 helicase family.
                                                                                                                                      Mus musculus (Mouse).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 3, Sequence 5, Sequence 5, Sequence 3, Sequence 4, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequence 6, Sequen

Patent No. 5474914
GENERAL INFORMATION:
APPLICANT: SPAETE, RICHARD
TITLE OF INVENTION: METHOD OF INCREASING EXPRESSION
TITLE OF INVENTION: OF VIRAL PROTEINS
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSE: CHIRON CORPORATION
STREET: 4550 Horton Street - R440
CITY: Emeryville
                                                                                                                                                                                                                                                                                                                             COUNTRY: USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 3, Application US/07921807B
Patent No. 5474914
GENERAL INFORMATION:
TITLE OF INVENTION: METHOD OF INCREASING EXPRESSION
TITLE OF INVENTION: OF VIRAL PROTEINS
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSE: CHIRON CORPORATION
STREET: 4560 Horton Street - R440
CITY: Emeryville
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/07/640,029
FILING DATE: 19910111
                                                                               CLASSIFICATION: 530
ATTORNEY/AGENT INPORMATION:

                                                                                                                                                              The sequence was obtd. from two overlapping clones, PL5 and PL10, isolated from a placental lambda gtil cDNA library. The DNA can be used to express recombinant bFGF receptor which is an antagonist of human aFGF and bFGF. The receptor can be used to treat abnormal angiogenesis (e.g. in diabetic retinopathy, neovascular glaucoma, etc., and possibly certain solid tumours), and in contraceptives. Dossage is 10.100 ug. See also AAQ13308-Q13311. (Updated on 25-MAR-2003 to correct PA field.
